Examiner:

Title: METHOD FOR WASHING LAUNDRY IN A PROCESS-  
CONTROLLED HOUSEHOLD WASHING MACHINE

Commissioner for Patents  
PO Box 1450  
Alexandria, VA 22313-1450

**INFORMATION DISCLOSURE STATEMENT**

Sir:

In accordance with 37 C.F.R. 1.98, I am submitting a completed "INFORMATION DISCLOSURE STATEMENT BY APPLICANTS" (*Form PTO/SB/08A*) with patents and/or publications as delineated therein attached.

EP 0 859 304 discloses a method for adjusting the temperature of a process medium (2), e.g. the washing solution in a washing machine. The washing solution (2) temperature is regulated to a preset control interval between an upper switch temperature and a lower switching temperature. This temperature regulating process involves controlling the thermal energy (Q) supplied to the liquid (23). The total of the thermal energy (Q) supplied to the liquid (2) since the start of the regulating process is registered and the supply of thermal energy (Q) is interrupted when this total exceeds a preset process energy value. A device is also claimed for adjusting the temperature of the washing solution.

DE 100 54 957 discloses a procedure wherein the method involves automatically varying the duration of the washing times of the individual washing stages depending on the water inlet temperature and/or including and/or excluding individual washing stages depending on the water inlet temperature, which is measured at the start of each washing stage.

EP 0 235 668 discloses a method for correcting the nominal supplementary washing time specific to a particular washing program for a washing process in program-controlled

drum-type washing machines with heating for the washing water. The time for heating the washing water from the first switch-on of the heating to the reaching of the particular selected desired temperature, at which the heating is switched off, is measured. The measured or determined time period is used as a criterion for positive or negative correction of the particular nominal supplementary washing time.

DE 29 23 007 discloses an arrangement for the electrical programme control of washing machines by means of a step-by-step wash programme which can be controlled in a time- and temperature-dependent manner, characterized in that, in order to implement wash programmes with temperature-induced programme progression, arranged in front of the temperature switching step which advances the programmer are one or more time steps, the total duration of said time steps being such that, under normal conditions, the wash liquor is heated to or at least approximately to the highest programme temperature, which is the temperature of the boil wash programme.

DE 199 08 804 discloses that the fresh water supply device (6) supplies fresh water while the drum (2) is driven at the speed at which the washing still lies against the inner drum periphery. The pump (20) of the circulating system (16) is kept switched on until the laundry is saturated. The fresh water supply is then switched off and the treatment liquor in the circulating system (16) is heated to an ideal value through a heater (22).

DE 198 54 435 discloses that the part of washing solution (8) is heated to the required temperature and supplied to the laundry (5) in the washing drum (4). An additional part of the solution (8) is then heated to the required temperature. The washing solution (8) can be divided into equal parts or parts which differ from each other. It can be divided into three parts.

DE 196 37 610 discloses that a combined hot and cold water supply is for washing machines. Hot water supplied from an external source is combined with cold water in a controlled manner to produce water with the required washing temperature. The water and the cold water flow together before being fed in the washing space and the throughflow volume of each type of water is controlled to achieve the required mixing ratio.

WO 03/097922 discloses a water-guiding domestic appliance, in particular a washing machine (1), connected to a first water supply line (8) for cold water and a second water supply line (9) for hot water. The water supply lines (8,9) are connected to a mixer tap (10) enabling water to flow into a lye container (3) via a supply line (11). The mixer tap (10) is

Attorney Docket No. 2003P01981WOUS

integrated into a regulating device (10, 12 - 14) used to regulate the temperature of the water flowing into the lye container (3).

If no translation of pertinent portions of any foreign language patents or publications mentioned within the "INFORMATION DISCLOSURE STATEMENT BY APPLICANTS" is included with the aforementioned copies of those applications, patents and/or publications, it is because no existing translation is readily available to the Applicants. As per the Notice in 1273 OG 55 (August 5, 2003) no copies of any above-mentioned US patents and US patent application publications are submitted for this application which was filed after June 30, 2003.

Respectfully submitted

Craig J. Loest
